glycerol, glycol, hexamethylenediamine, oligomer, adipic acid,

ABSTRACT: The development of methods for preparing polymers via oligomers involves the development of a synthesis of oligomers with terminal reactive groups. The article presents data on the synthesis of adipic acid.

L 60047-55

ACCESSION NR: AP5017960

only if the molar ratio of glycerol to acid is 1:5, so that no polymers are formed. Esters of adipic and sebacic acid were thus obtained and identified. The oligomers were synthesized by condensing tribasic glycerocacids with hexamethylenediamine and glycols. It was found that also in this case, when the ratio of glycerocacids to the other component is 1:5, the reaction proceeds with the formation of oligomers as follows:

TITLE: Reaction of aluminum bromide with octamethylcyclotetrasiloxane

SOURCE: Zhurnal obshchey khimii, v. 36, no. 1, 1966, 105-107

TOPIC TAGS: organosilicon compound, aluminum compound, bromide

ABSTRACT: The reaction between octamethylcyclotetrasiloxane and aluminum bromide under various conditions and with various proportions of the reactants was studied. The authors found that the reaction proceeds in accordance with the mechanism proposed earlier for the reaction between aluminum chloride and octamethylcyclotetrasiloxane:

TOPIC TAGS: screw machine, lathe/NT-139 screw machine

ABSTRACT: The paper concerns a NT-139 screw machine manufactured and introduced into production at the Minsk Watch Plant for cutting threads into eight and four apertures of "Luch" platinum watches (M 0.7 x 0.175 and M 0.6 x 0.15). A kinematic diagram of the lathe is given and the principles of its operation described. The output is 4500 components per shift. The lathe is easy to adjust as well as to use. Title : Study, coordination, and dissemination of advanced methods of work on underground repair of oil wells

Periodical : Neft. Khoz., v. 32, #4, 1-4, Ap 1954

Abstract : The author describes the study and development of rational methods for underground repair work in oil wells as performed by the Central Scientific Research Institute for Mechanization and Organization of Labor in the Petroleum Industry (TsIMTNeft) and its branches. The experience and initiative of advanced brigades, shifts and individual innovators is considered in the promotion of the new methods for repair of oil wells. Essential material, tools and machines are assembled in regional oil fields for special crews trained in photo-chronometric methods of operation in accordance with a pre-planned schedule. The perfected method of repair work with Molchanov's automatic mechanism is specially

TITLE: Welding Engineering in the All-Union Industrial Exhibition 1957
(Svarochnaya tekhnika na Vsesoyuznoy promyshlennoy vystavke 1957 g.)

PERIODICAL: Svarochnoye Proizvodstvo, 1957, # 12, p 38-44 (USSR)

ABSTRACT: The article is an illustrated review of the new Soviet welding equipment shown during the industrial exhibition 1957. The following devices and materials were shown in illustrations and/or described in some detail in the review. The All-Union Scientific Research Institute for Welding Equipment (Vsesoyuznyy nauchno-issledovatel'skiy institut svarochnogo oborudovaniya, VNIIESO) demonstrated the cold welding machine "MCXA-50" (Figure 1) for reinforcing aluminum winding lead-outs with copper terminals, joining copper plates to aluminum bus-bars, and for cold spot welding of aluminum up to a thickness of 4+4 mm, with initial pneumatic pressure of 6 atm, welding pressures of 50 tons, and an operating speed of 300 weldings per hour.

Card 1/5

The Electrical Engineering Institute of the Ukrainian Academy of Sciences (Institut elektrotekhniki AN USSR) demonstrated manual pliers for butt and overlap cold welding of aluminum

135-12-14/17

Welding Engineering in the All-Union Industrial Exhibition 1957

and copper wires, "KC-6" (Figure 2), of 1.5 kg weight, handy in assembling work.

The Scientific Research Institute of the Cable Industry (Nauchno-issledovatel'skiy institut kabel'noy promyshlennosti, NIIKP) showed the "НИИКП-ПС-7" device (Figure 3), for cold butt welding of aluminum wires, copper wires, and aluminum wires with copper wires.

The friction welding method is demonstrated in the VNIIESO stand on a friction welding device and high-quality welded joints of brass with steel, brass with cast iron, aluminum with duralumin, etc. are shown.

The Central Scientific Research Laboratory of the USSR Academy of Sciences (Tsentral'naya nauchno-issledovatel'skaya laboratoriya AN SSSR) exhibits the electric spark device "УП-3М" with a pistol fixture for surfacing tools and other wearing surfaces with wear-resistant alloys, with an accuracy of 0.1 mm thickness. The device may be also used for cutting thin sheet metal.

Card 2/5

The ultrasonic soldering device "УП-21" (Figure 4) solders aluminum and aluminum alloys without the use of fluxes, by

135-12-14/17

Welding Engineering in the All-Union Industrial Exhibition 1957

and alkaline-earth metals (no closer specification given), and which permits welding titanium with standard welding equipment on d.c. of inverse polarity.

The device of the NKMZ (Kramatorsk) for electric slag welding with melting wire-holding tubes (Figure 7, foreground) differs from the usual electric slag welding technology by the use of a so-called technological plate of an outline identical with the outline of the section to be joined (Figure 8). The plate with the attached tubes carrying the welding wire will be inserted into the gap at the joint and melts together with the welding wire and tubes in the rising welding puddle.

The Zhdanovskiy Metallurgical Institute demonstrates a torch (Figure 9) for automatic arc welding thin stainless steel sheets with melting electrodes in CO₂, which is simple in design and needs no cooling.

The machine "MC-O,75" (Figure 10) for contact butt welding wires of ferrous and non-ferrous metals and alloys (producer not identified), receives power from a 220 volt network and makes 9 welds per minute.

Welding transformer (producer not identified) "BCC-120-1"

Card 4/5

135-12-14/17

Welding Engineering in the All-Union Industrial Exhibition 1957

(Figure 11), for manual d.c. arc welding thin sheet metal, differs radically from the designs built in USSR thus far. It has no rotating parts and consists of a reducing three-phase transformer, a welding current reactor-adjuster, a rectifier block and a starting-adjusting arrangement, all mounted in one housing. The rectifier block consists of a three-phase bridge circuit of 100 x 400 mm selenium discs of the "ABC" type on an aluminum base. (The characteristic of this transformer is given).

The gamma-apparatus "ГΥΠ-CO-50" (Figure 12), unidentified manufacturer, is for laboratory as well as industrial use and works on 220 volt a.c.. Its gamma ray source is Co⁶⁰. Its conical gamma ray beam reaches through 200 to 500 mm steel.

There are 12 figures.

TITLE: Welding Technique, at the 1959 Exhibition of the Achievements
of the USSR National Economy

PERIODICAL: Avtomaticheskaya svarka, 1960, Nr 3, 84-92

ABSTRACT: The exhibits are listed with brief description of the essential features. The "SDVU-2" welder, for diffusion welding⁴ of ceramics, cermet, parts of heat-resistant steel and non-ferrous metals in a vacuum by the N.F. Kazakov method was designed by the Moskovskiy tekhnologicheskii institut (Moscow Technological Institute) in cooperation with Kombinat tverdykh splavov (Hard Alloys Combine). It consists of a tube generator, a vacuum chamber, a base plate and a hydraulic cylinder and weighs 500 kg without the generator. The Novo-Kramatorskiy zavod im. Stalina (New-Kramatorsk Plant imeni Stalin) exhibited a 14-ton electroslog-welded specimen, and the Institut elektro-svarki im. Ye.O. Patona (Institute of Electric Welding imeni

National Economy

Ye.O. Paton) the "A-372r" and "A-501" electrosag welders. The "A-372r" is for single-pass welding of various (circular, butt, T, etc.) metal joints of 50 to 600 mm thickness; the "A-501" is a magneto-walking welder for vertical angle joints, T and butt welds up to 100 mm thickness. For cold butt welding of single-wire cables and thick wires the Institut elektrotekhnik AN USSR (Electrical Engineering Institute AS UkrSSR) has developed the "SNS-2" table welder; multicore cables can be joined by connecting single cores in sequence; aluminum² wire of 4-25 mm² cross section area, copper wires of 4-10 mm² as well as copper with aluminum can be joined. The "KS-6" hand tongs are for welding aluminum wires with copper wires. The installation for thermite welding of multiwire high-voltage transmission lines, developed by Tsentral'naya vysokovol'tnaya laboratoriya Mosenergo (Central High-Voltage Laboratory of Mosenergo) collectively with Zavod Mosoblsovnarkhoza (Mosoblsovnarkhoz plant) joins the wires by means of simple

tongs with thermite cartridges. There are several ultrasonic welding, soldering and tinning devices: The "UZSM-1" spot welder for thin sheet metal in which the welding tool tip presses the sheets together with an effort adjustable between 20 and 100 kg, developed by Nauchno-issledovatel'skiy tekhnologicheskii institut' (Technological Scientific Research Institute); the "UZTM-2" for seam welding, with the same generator and transformer having contact rollers driven by a separate motor and a welding speed of up to 850 mm/min; the "UT-4" spot welder of MVTU-MEI, for welding copper and its alloys, stainless steel, aluminum and aluminum alloys, high-melting metals etc. having a thickness of up to 1.5 mm, is used with an "UZG-10" ultrasound generator and makes 20 spot welds in a minute; the "UP-31" device for tinning and soldering aluminum and aluminum alloys with soft solders without flux; the "UZP-3" for tinning and soldering

National Economy

aluminum parts with a rate of 1-2 cm²/min; the "UP-42" for the same purpose as the two last mentioned devices. Of great interest for welders is a plasma-jet nozzle of the Institut metallurgii im. A.A. Baykova (Metallurgical Institute imeni A.A. Baykov). It has an electrically neutral channel comprised of two electrodes one of which is in the shape of a nozzle and produces an electric discharge ionizing the gas flowing through the nozzle. The bright plasma jet out of the nozzle is 15-20 mm long and has a temperature of 15,000° C. Argon, helium, hydrogen, CO₂ or other gas can be used. The plasma jet can be used for melting, welding, soldering, cutting metal and other materials, coating different materials, hardening the surface and cleaning. The "AGN-8-26M" welding head (of NIKhimmash) with a hoseless gas feed is designed for welding the butt joints of fixed stainless steel tubes of 8-25 mm diameter and 1.5-2.0 mm

Card 4/11

National Economy

wall thickness by use of a non-melting electrode in shielding gas. Unlike the existing ("AGN-8-26", "MS-19" and others) welding heads, argon is fed into the "AGN-8-26M" by a device with immobile and mobile ducts. The semiautomatic "A-547" of the Institute of Electric Welding imeni Ye.O. Paton is for welding thin metal by short seams with a melting electrode in shielding carbon dioxide gas for welding in any position. The "PDPG-300" of VNIIESO is a semi-automatic welder for direct-current welding by a melting steel electrode in shielding gases. The electrode diameter is 0.8-2 mm, the wire feed is adjustable between 1.5 and 16 m/min, the current 300 amp, 15-40 volt and the gas consumption is 600-1500 liter/hr. VNIIAVTOGEN exhibited new gas-electric cutters which cut, by "penetrating arc", non-ferrous metal and stainless steel up to 40 mm thickness. The "UDR-1-58" for straight cutting on a self-propelled carriage and the "UDR-2-58" for manual

National Economy

cutting. The "UDS-58" of the same institute is an arc welder suitable for mechanical as well as manual welding of non-ferrous metals by a melting electrode in shielding gas. The knapsack type semi-automatic "PShV-1" for arc welding in shielding gas by a tungsten electrode welds straight and curved seams in any position the nozzle rests on the filler wire in the process which ensures constant arc length. The "PShP-9" is a semi-automatic hose welder for irregular shaped short welds in shielding gas in structural heat-resistant and stainless steel and light alloys. The "ADSP-2", an arc welder for the same metals, is a "welding tractor" working automatically. The "ADSV-2M" is another "tractor" working with a nonmelting electrode and filler wire. The semi-automatic "PGSh-2M", of TsNIITMASH, is for welding by a melting electrode of 1.6-2 mm diameter in CO₂ with up to 500 amp current and with the wire feed speed controlled by changing the r.p.m. of the motor between 10.8 and 648 m/hr. The

National Economy

"UDAR-300" (photo, Figure 1) of the "Elektrik" plant is for manual arc welding of aluminum and aluminum alloys by a non-melting electrode in argon using a.c. up to 300 amp. The "ADPG-500" welding tractor of VNIIESO is for welding by d.c. in shielding gas by melting steel wire. The following resistance welding machines were demonstrated: the "SHKM-3", a universal capacitor-type seam welder designed by the Institute of Electric Welding AS UkrSSR and the Kiyevskiy politekhnicheskii institut (Kiyev Polytechnical Institute) having an electronic control of the capacitors and used for ferrous and nonferrous metal of 0.05 to 0.7 mm thickness; the capacitor-type "MShK-3-2" of VNIIESO for stainless steel and nonferrous metal of 0.03 to 0.2 mm thickness; the "MRK-3" roller welder for seam welding on bellow thermostats and membrane boxes of steel and bronze with welding pulses from a battery of capacitors. The Institute of Electric Welding

imeni Ye.O. Paton demonstrated a surfacing welder (photo, Figure 2) with a thin metal band for the electrode to ensure a high productivity and even coating layer which moved 4-12 m/hr and coated a layer of 2-8 mm in a single run. The Ural'skiy politekhnicheskiy institut im. S.M. Kirova (The Ural Polytechnical Institute imeni S.M. Kirov) displayed the automatic vibro-arc "VC-2" welder (Figure 3) for cylindrical and flat work which is suitable for high-alloy steel including high-speed cutting grades, welds in shielding medium of a 4-per cent solution of calcinated soda, or a 10-per cent sodium fluoride or on CO₂. The automatic "D-1" of the Ukhtinskiy mekhanicheskiy zavod (Ukhta Mechanical Plant) is designed for vibrational surfacing of steel and cast iron work with steel in a jet of cooling liquid - the welding head is used on a lathe toolpost. The automatic "KUMA-5M" of the Chelyabinskiy zavod im. S. Ordzhonikidze (Chelyabinsk Plant imeni S. Ordzhonikidze) used for pulse-arc surfacing

Card 8/11

of worn machine parts by applying coatings of 0.5 to 3 mm is also used on lathes. The "EM-9" of VNIIAVTOGEN for restoring worn shafts, bushings, etc. can also be used for patching steel and nonferrous castings and for raising the heat-resistance of steel. The vibrational welding head of Engineer A.M. Barabanov is for surfacing worn parts with layers of 0.5-2.5 mm. The few devices for welding under flux include the following: the "A-564" of the Institute of Electric Welding imeni Paton, for attaching 4-12 mm diameter studs by welding with special flux rings in a vertical and overhead position it attaches a stud in 1.2 - 3 sec. and weighs 2.2 kg; and the "UT-1250-3" welding tractor of TsNIITMASH which automatically welds butt and angle welds. The gas cutter "MZRKhS-58" (Figure 4) of the Kherson Sovnarkhoz, weighing 25 kg, is designed for trimming the edges of round parts and can replace a turret lathe for trimming parts of 600 to

Card 9/11

National Economy

3,000 mm diameter and 5-100 mm thickness and an electro-magnet of 100 kg pulling force is placed in the machine base to hold it in a vertical position. N.M. Kudryavtsev's machine (Figure 5) is a gas cutter for pipes of 57-529 mm diameter and 1-12 m length - it can cut straight and with different bevel angles and can cut out apertures in pipe walls; it is driven by an a.c. 0.6 kw motor and has a "bevel variator", a worm gear reductor and a pair of spur gears. The "dry" acetylene generator "ASR-1-56" (Figure 6), of VNIIVTOGEN, gives dry powdery waste line and has a work capacity of 20 m³/hr - 80 kg of carbide are charged at a time. The "VSS-300-2" welding rectifier, of VNIIESO, is for manual d.c. arc welding with current from an a.c. network and has aluminum transformer windings plus an automatic overheating switch. The single-pole "TSK-300" transformer (Figure 7) is for use in manual arc welding, cutting and surfacing, and has a capacitor in parallel with the primary winding to raise the power factor (the mean

value of power factor is 0.93). The mobile "STN-500-1" transformer of the Vil'nyusskiy zavod elektrosvarochnogo oborudovaniya (Vil'nyus Electric Welding Equipment Plant) is for manual cutting and welding. The "IST-1M" instrument of the Ufimskiy zavod (The Ufa Plant) measures the current flowing through parts being welded on resistance welding machines. The "IDTs-1" ultrasonic defectoscope of TsNIITMASH reveals defects in metal parts in disc form with a central bore - the results are mechanically recorded and visually observed on indicators. The magnetic "MPD-1" mobile defectoscope (also TsNIITMASH) tests large metal parts by magnetic powder and is fitted with a portable pump. There are 7 photographs.

TITLE: The Ultrasonic Y3CM-1 (UZSM-1) and Y3CM 2 (UZSM-2) Welding Machines

PERIODICAL: Byulleten' tekhniko-ekonomicheskoy informatsii, 1960, No. 5, pp. 12 - 15

TEXT: The Nauchno-issledovatel'skiy tekhnologicheskii institut (Scientific Research Institute of Technology) NITI in 1959 developed the UZSM-1 and UZSM-2 machines for the ultrasonic spot and seam welding of sheet metals. The operation principle of the machines is based on the conversion of high-frequency electric oscillations into horizontal mechanical oscillations of high frequency. The main part of the machines is the magnetostriction converter of the ПМС-15 (PMS-15) type, which in the UZSM-1 machine is fed from the serial Y3Г-10 (UZG-10) or Y3Г-2,5 (UZG-2,5) generators. In the UZSM-1 machine, devised for spot welding, the oscillations of the converter are transmitted through a waveguide to the upper cap fastened to the tool tip. The tool is detachable to enable it being replaced when the cap is worn or if it is necessary to produce welding spots of another size. The magnetostriction converter and, during protracted operation, also the tool with Card 1/3

X

cap and conductor are water-cooled. During operation the workpieces are clamped with the aid of an pneumatic device, the compressive force of which can be regulated by changing the air pressure. The duration of the welding process is set with the aid of a time relay. For the preliminary setting of the welding time the machine has two scales, one for rough setting with an accuracy up to 1 second, the second scale for a smoother control with an accuracy of up to 0.1 second. Copper, aluminum and its alloys, stainless steel, high-melting and other metals can be welded on the UZSM-1 welder. Also different metals can be welded together, e.g. aluminum to copper, copper to stainless steel etc. The ultrasonic UZSM-2 welding machine has been devised for the seam welding of sheet metals. It has the same magnetostriction converter as the UZSM-1 machine. The welding tool has an upper cap in the form of a roller, while a lower roller is fastened to the bracket. The welding speed is adjusted on a scale placed on the front side of the machine. In contrast to the spot-welding machine, the magnetostriction converter of the UZSM-2 machine rotates together with the welding tool. The cooling water is supplied from the mains to the converter through a connecting joint. The workpieces are clamped after a foot pedal has been pressed. To guide the components properly during the welding process, a small table with bedways is fastened on the level of the upper

edge of the lower welding roller. The bedways can be adjusted according to the width of the sheets being welded. The machine is supplied from a UZG-10 or UZG-2,5 generator with a power consumption of 5 kw and a power output of 2.5 kw. The following technical data are given concerning both the UZSM-1 and UZSM-2 models (data of the latter in brackets): power of magnetostriction converter, kw - 2.5-4 (2.5-4); operation frequency, kcps - 19.5 (19.5); power of driving electric motor, kw - -- (0.12); clamping stress, kg - minimum - 20 (20), maximum - 100 (140); maximum distance of spot or seam from the sheet edge (tool sweep), mm - 75 (135); duration of welding, sec. - 0.5 - 3; welding speed, mm/min: minimum - -- (75), maximum - -- (850); thickness of sheet being welded - 1.5 (1.5); water consumption, l/min - 3 (-); air consumption, m³/min - 0.003 (-); overall dimensions (length x width x height), mm - 670 x 430 x 1,250 (950 x 490 x 1,320); weight, kg - 120 (200). TITLE: All-Union Scientific-Technical Conference on the Use of
Semiconductor Power Rectifiers

PERIODICAL: Avtomaticheskaya svarka, 1960, No. 5, pp. 94-95

TEXT: Information is given on a conference held in November 1959 in Moscow, on the use of semiconductor rectifiers in transportation and at industrial works, including welding. I. Salynskiy, in his report "Semiconductor (selenium) Rectifiers For Welding Machines" treated the problems of the selection of selenium cells, their calculation, design and the test of rectifier units; he outlined the advantages thereof, compared to the rotary converters (higher efficiency, economy of nonferrous metals, reduced dimensions and current losses). The Soviet industry produces now semiconductor rectifiers applicable for welding transformers - silicon, germanium and selenium diodes. The silicon and germanium rectifiers are highly efficient, but only few are produced yet and they are expensive, but the production of selenium rectifiers has been improved considerably. Cells with 60-80 volt reverse voltage are under development; the load

S/125/60/000/05/14/015

All-Union Scientific-Technical Conference on the Use of Semiconductor
Power Rectifiers

currents of cells under development and already produced is raised three and even five times. Thallium elements have considerable advantages except for their life, though it appears that it can be extended. In view of this thallium elements of 100x400 mm size were accepted for development. A selenium unit of such elements has one third of the elements of a normal rectifier, it is 2.6 times smaller, 2.9 times lighter, and 50% cheaper. They can be recommended for use in welding transformers for 120 and 300 amp. Converters with saturation chokes and mobile coil transformers have been tested, and the converters with coils ("VSS-120-3" and "VSS-300-2") proved considerably better from the technical and economical point of view. B. V. Strogov reported on "Experience in Making and Using Selenium Rectifiers" and described a selenium rectifier with saturation choke for welding purposes. M. M. Smirnov informed on production and application of semiconductors at the Avtozavod im. I. A. Likhacheva (Automobile Plant imeni I. A. Likhachev), where a new converter, "SP-300" is being developed for 200 kva. The secondary windings of the transformer and the choke are put together; current is adjustable between 300 and 30 amp, idle run voltage is 72. Negative feedback gives an abrupt external

All-Union Scientific-Technical Conference on the Use of Semiconductor Power Rectifiers

characteristic (the ration of short-circuit current to welding current is 1.2). For better protection from corrosive medium and better cooling of selenium plates, the rectifier unit was placed into a container with transformer oil. The plates are "TBS-100", 288 in all, with two plates connected in series and 24 parallel in every arm. The electromechanical shop of the plant has completed 12 such converters. Besides, the welding laboratory of the Automobile Plant produced a welder, "BG-50", with semiconductor rectifiers. It includes a welding transformer of "ST-2" type and a "REST-2" choke; the germanium diode was cooled by water and the permissible current could be raised to 200 amp. It was stated in comparison tests with the machine converter "PS-300" that even with so imperfect a system the machine with germanium rectifiers had still 67.5% efficiency compared to only 41% of the machine converter. After eight months of use the unit with germanium rectifiers had to be stopped because of clogged pipes in the water cooling system. An analogous machine is completed by now with a protection without water cooling. V. P. Kamenskaya treated methods for a determination of overload capacity of rectifiers and other

TITLE: Introducing Modern Welding Engineering Into the National Economy

PERIODICAL: Mekhanizatsiya i avtomatizatsiya proizvodstva, 1960, No. 7, pp. 54-55

TEXT: New welding equipment listed in the article will be demonstrated in July and August 1960 at the exhibition of achievements of the national economy of the USSR. Welding manipulator "YCM-500" (USM-500) of 500 kg lifting capacity is applicable at many USSR plants; manipulators, or positioners, for heavier work will be "CM-1000P" (SM-1000P) with a pneumatic drive lifting up to 1,000 kg, universal "CM-1000" (SM-1000) hand-driven positioner; universal "YCM-1200" (USM-1200) manipulator; universal "CM-5000" (SM-5000) positioner for 5,000 kg. The new plasma jet cutting method will be demonstrated, permitting the cutting of all known materials including materials of highest heat resistance, stainless steel, ceramics. The plasma method is also applicable to welding and spraying. Installations

Introducing Modern Welding Engineering Into the National Economy

will be shown for plating with heat-resistant metals, for welding by plasma arc, for automatic and manual cutting by plasma jet, and for straight-line cutting of sheets. Specialists will see a special electron-ray welding installation for active metals, and an analogous electric system; A "BYAC" (VUAS) welder for welding active metals in controlled atmosphere and an "YCKB" (USKV) for roller welding in vacuum. Machines for ultrasound welding will include an "Y3CM-1" (UZSM-1) for ultrasound spot welding; an "Y3CA-2" (UZSA-2) for ultrasound seam welding; a transportable "Y3CA-3" (UZSA-3) welder; an "Y3T" (UZT) spot welder; an "Y3W" (UZSh) with roller contacts; "Y3CMM" (UZSPM) for welding polymers. The cold butt welding machines "MCXC-35" (MSKHS-35) and "MCXC-5" (MSKHS-5) can weld aluminum to copper, aluminum to aluminum, and copper to copper. The "MCT-34" (MST-34) friction butt welding machine with pneumo-hydraulic grips and pushbutton control is an automatic machine for large steel and alloy parts. Besides, there will be equipment for diffusion welding in vacuum; for making flexible hose by roller welding; for welding aluminum alloys of high thickness; for sheets less than 0.2 mm thick; for welding thin sheet structures by pulsating arc; for argon arc welding by fusing electrodes on immobile butt

Introducing Modern Welding Engineering Into the National Economy

joints of aluminum alloy gas line pipes; for welding with rotating arc in magnetic field. Standardized units for combinations into different special welding devices will include a standardized "ATB" (AGV) welding head for tungsten electrode, automatic "AACB-2" (ADSV-2) and "AACP-2" (ADSP-2) "welding tractors" composed from standardized units and designed for welding with tungsten and with fusing electrode, and universal "AACPB-2" (ADSPV-2) automatic "tractor", also of standard units. Welding techniques will be demonstrated. The welding of plastics and spraying of plastics on surfaces will also be shown. In the section of resistance and arc welding there will be new automatic equipment. A "MWW-400" (MShShI-400) machine for seam welding of light alloys will be shown in operation. Different welding process watching devices will be exhibited, among them an "PTC-1" (RTS-1) current recorder, an "ACT-2" (AST-2) for measuring current in single-phase welding machines and making possible the watching of the major parameter in resistance welding process; a "PBC-1" (RVS-1) time recorder recording the time of the current passage in resistance welding. One gas cutting semi-automatic is expected to arouse much interest, it is designed for cutting complex lines, eliminates the use of templates, gives a clean cut, ensures tight pipe joints, and reduces 8 times the cutting time comparing

TITLE: An Exhibition of Welding Techniques

PERIODICAL: Vestnik elektromyshlennosti, 1960, No.10, pp.62-65

TEXT: The Engineering Pavilion of the Exhibition of Achievements of the National Economy contains an exhibition of modern welding technique; this note mentions the main exhibits. Resistance butt-welding machine type MPC-50 (MSR-50) of 50 kW is used for sections up to 800 mm². The travel of the moving tip is 30 mm and the maximum distance between tips 100 mm. A pipe-welding machine producing pipes of from 0.5" to 1.25" is shown. Machine type MTPP-75 (MTPP-75) will spot-weld parts of low-carbon steel 0.5 to 1.5 mm thick. The machine cycle is governed by an electronic time controller type PBE-7 (RVE-7). The machine also has an asynchronous ignitron contactor type KIA-50 (KIA-50). The output of the machine is 60 to 120 spots per minute. Machine type MCMY-150 (MSMU-150) carries out butt-welding on low-carbon steel parts of 1000 mm² section. The machine can make 80 welds per hour, the power is 150 kVA and the compressive pressure is up

An Exhibition of Welding Techniques

to 6500 kg. Machine **MCM-150** (**MSM-150**) uses a continuous melting method to produce butt-welded tubes for refrigerator coils. Control mechanisms are particularly important. Welding-current recorder type **PTC-1** (**RTS-1**) records and measures the welding current and power in the circuit; the sensitive element is a germanium Hall-effect pick-up. Time controller type **PLC-1** (**RTS-1**) provides universal sequence and time control for the automatic cycle of a resistance welder. Instrument type **ACT-2** (**AST-2**) can measure the current in single-phase welding machines, thus permitting control of the main parameter in resistance welding. An automatic welding-current controller maintains constant welding current with varying welding circuit parameters. The All-Union Scientific Research Institute of Electrical Welding Equipment demonstrates equipment type **УСЭП-1** (**USEL-1**) intended for welding with an electron beam in vacuum on metals that oxidize rapidly and are hard to melt. A similar equipment type **ЭЛУ-1** (**ELU-1**) is used with chemically-active metals which react with the atmosphere. The new equipment type **ВУАС** (**VUAS**) for automatic

TITLE: Automatic and Semiautomatic Welding Under Flux 18

PERIODICAL: Svarochnoye proizvodstvo, 1960, No. 12, pp. 14-18

TEXT: The author reports on equipment for welding under flux shown in an exhibition, including the following machines. The TC-32 (TS-32) (Figure 1) welding tractor, intended for single-pass, one-sided automatic welding under flux on d.c. of 3-12 mm thick steel sheet butt joints. One-sided welding with full penetration is performed on a water-cooled copper slider, forcibly forming the lower bead of the seam. The technical characteristics are: diameter of the electrode wire: 2-5 mm; electrode wire feed rate: 2.3-4.7 m/min. Welding rate: 24-50 m/hour; rated current - 900 amp; control limit of the welding current - 400 to 1,200 amp; feed voltage 220 or 380 v; clamping force of the lower suspension with the travellers - 500 to 600 kg. The TC-33 (TS-33) tractor is intended for the automatic welding of aluminum with a semi-open arc on a flux layer. It is equipped with a multi-purpose attachment for arranging the seam between the wheels and at the side of the tractor and can be used for welding butt and angular joints

on up to 40 mm thick metal and annular seams on containers of 1,000 mm in diameter and more. The technical characteristics are: electrode wire diameter - 1 to 4 mm; welding current - 100 to 800 amp; welding rate - 8-60 m/hour; dimensions of the machine: 750x350x480 mm. The multi-purpose VCA-500 (USA-500) welding machine (Figure 2) is intended for arc welding on d.c. of straight and annular overlap and butt joints with or without final shaping, with consumable electrodes under flux, in argon or other shielding gases; with unconsumable electrodes with or without filler metal in a gas shield. Technical characteristics: maximum welding current - 500 amp; electrode wire diameter - 0.4-2 mm, tungsten electrode diameter - 2 to 6 mm; electrode wire feed rate: 80 to 1,425 m/hour; welding speed 10 to 60 m/hour. The ADMT-300 (ADMT-300) welding machine (Figure 3) can be used for overlap welding 0.5-3 mm thick metal and thin sheets with plates (overlap of about 1 + 40 mm) under flux or in shielding gas; two electrodes may be used. Technical characteristics: welding wire diameter, 0.2-1.2 mm, electrode wire feed: 1-36 m/min; welding speed: 4-130 m/hour; welding current up to 350 amp; dimensions: 550x170x400 mm; weight - 25 kg. The ADK-500-6 (ADK-500-6) machine designed by VNIIESO, is intended for arc welding under flux or annular seams, arranged on a horizontal, vertical or inclined surface. A round table, a feed mechanism with a welding head and a control desk are mounted on a stand, the table

rotates at 0.18-2.61 rev/min; the electrode wire diameter is 1.6-2.5 mm; the electrode feed rate is 1.5-16 m/min; the diameter of welded annular seams is 150-600 mm; maximum weight of the welded work piece is 400 kg, d-c of 180-600 amp is used, feed voltage is 220 or 380 v; dimensions of the unit: 2,200x1,300x1,747 mm, weight 650 kg. The АСГК-1 (ASGK-1) automatic welding head, developed by NIITRAKTORSEL' KhoZMASH is intended for welding annular seams and is an exchangeable unit of the multi-purpose YCA-2 (USA-2) welding tractor. The head may be used for welding longitudinal seams on a work piece moving toward the fixed head. Welding may be performed under flux and in a shielding gas. Technical characteristics: 150-600 amp current; 25-40 v arc voltage; 50-650 m/hour electrode feed rate; 1.2-3 m welding wire diameter; dimensions: 1,000x250x700 mm; weight 50 kg. The automotive ТФД-1000 (TFD-1000) automatic machine is intended for welding with a three-phase arc of low-alloy and carbon steels by single-pass and multi-pass large seams, using 2 electrodes under flux. The arcs are burning between the electrodes and between each electrode and the work piece. Due to the absence of throttles and other special resistances, the voltage in the circuit remains practically constant. The diameter of the electrode wire is 3-4 mm, current on the electrodes - 400-1,200 amp, current in the work piece circuit - 200-1,500 amp; electrode feed rate - 200-600 m/hour; welding speed - 17-50 m/hour. Efficiency
